Sprint 2 Presentation

(02/22/2026 to 03/24/2026)

05-SP26-FA26-PAHIFC-WEBMOB

Introduction

Project Description

The Palouse Alliance Community Research Platform is a centralized website designed to help Palouse residents find local events, services and resources. It also helps community members post and advertise events for users to attend.

Team Roles

- Vijay Deva (Integration Manager)
- Omar Adil (Frontend Developer)
- Kaeden Peterson (Backend Developer)
- Aryan Puthran (Database Manager, Team Lead)

Sprint Objectives

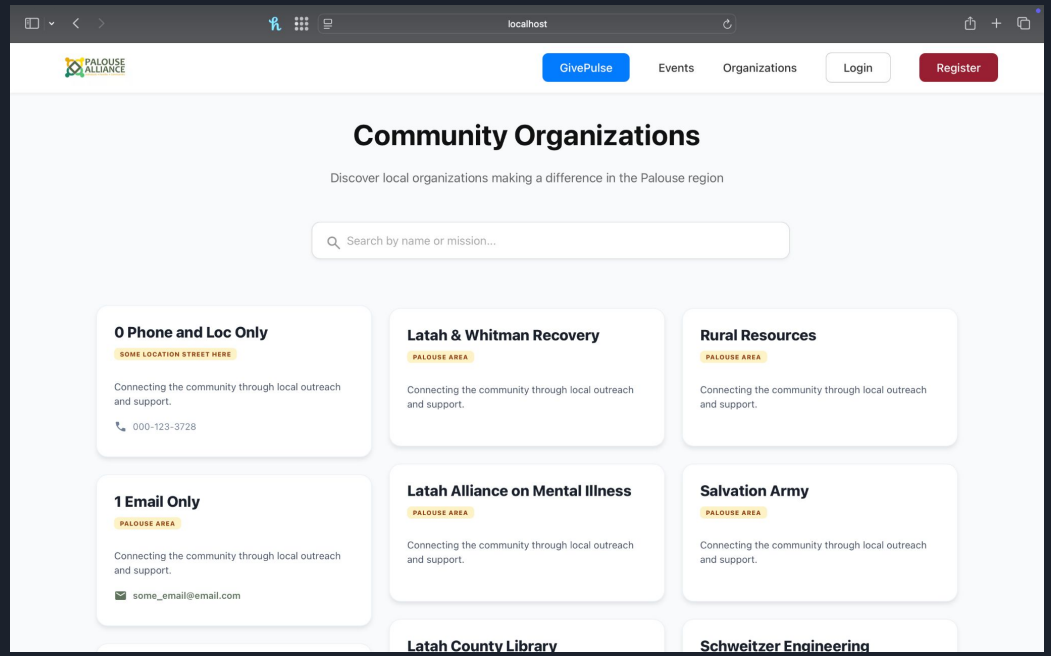
Main Sprint Goals

- Finalize database and link with current frontend UI (Login page)
- Draft basic landing page components/features
- Enable users to post an event
- Finalize account management/creation workflow (client sided)

Rationale and Vision

This sprint focuses on creating the foundational steps for the application so we have time to improve on these features during our next few sprints. To do this we focused on creating our event creation method, authentication workflows, and secure database integration since these are all critical user stories/roles.

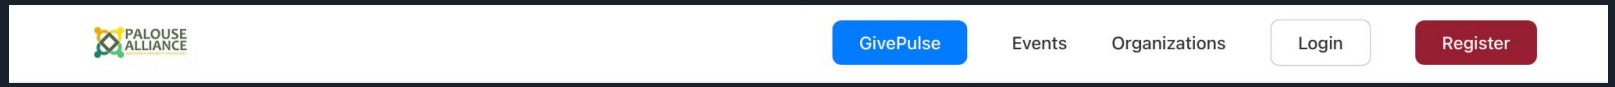
Feature Demonstration - Organization and Agency Listing Page



- Organization dynamically page fetches and displays a list of partners.
- Once we get more tables setup, we will get a result that looks closer to the mockups.

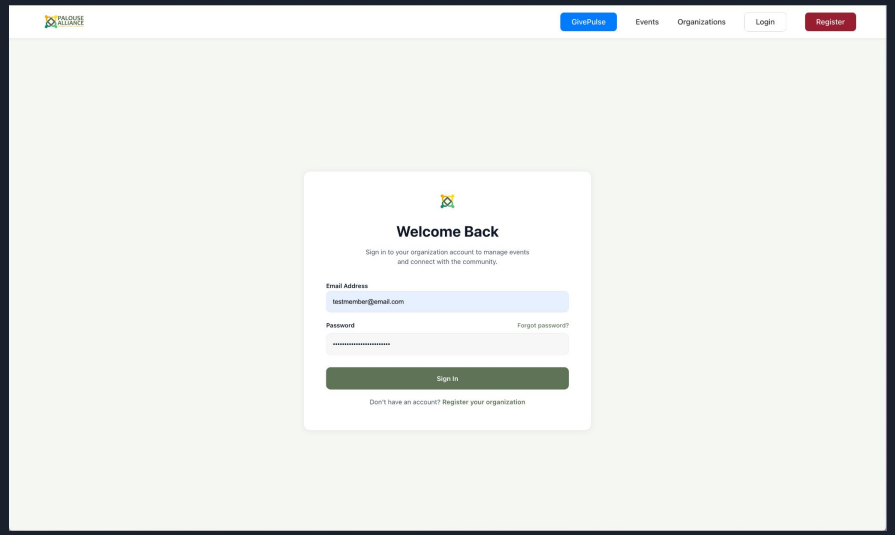
Feature Demonstration - Volunteer Box Integration

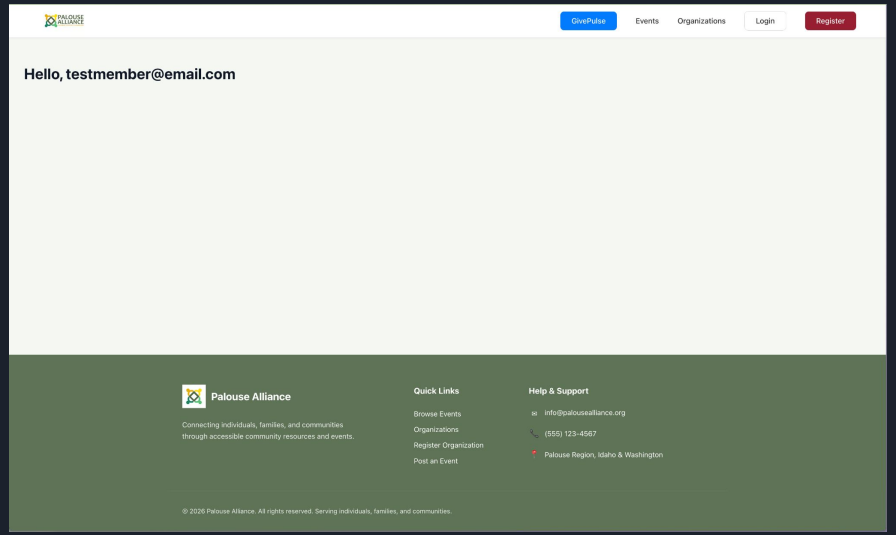
- Button in the navigation bar that is directed to the GivePulse page.



Feature Demonstration - Member Login (Backend Implementation)

- Added backend functionality (users can log in now).
- Cleaned up login page.





Feature Demonstration - Create RLS for Sprint Features

users

Disable RLS | Create policy

NAME	COMMAND	APPLIED TO
users_delete_admin	DELETE	authenticated
users_insert_admin	INSERT	authenticated
users_select_role	SELECT	authenticated
users_update_role	UPDATE	authenticated

organizations

Disable RLS | Create policy

NAME	COMMAND	APPLIED TO
organizations_delete_admin	DELETE	authenticated
organizations_insert_admin	INSERT	authenticated
organizations_select_public	SELECT	public
organizations_update_members_admin	UPDATE	authenticated

Feature Demonstration - Create RLS for Sprint Features Continued

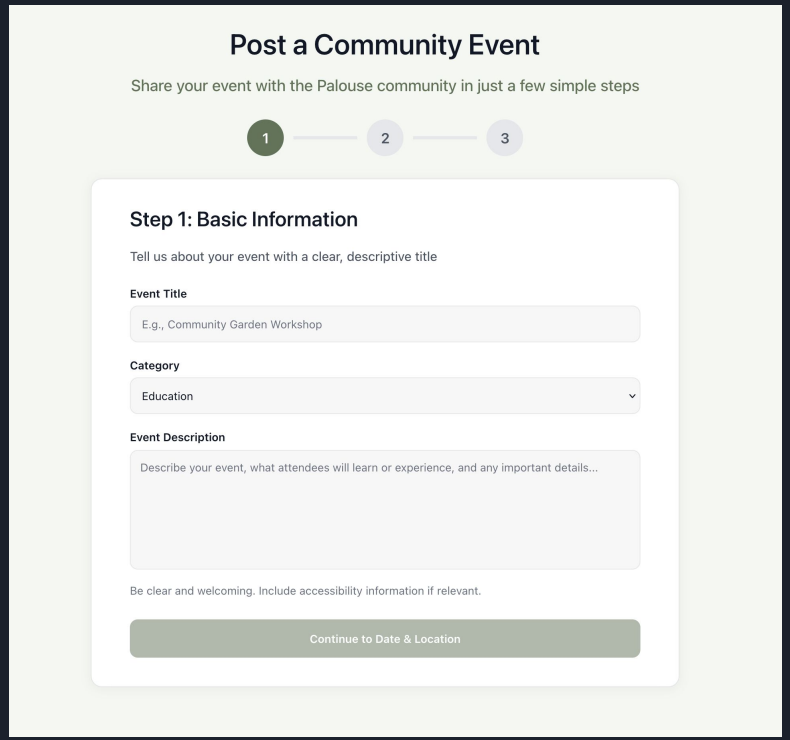
events

Disable RLS | Create policy

NAME	COMMAND	APPLIED TO
events_delete_by_admin	DELETE	authenticated
events_insert_by_role	INSERT	authenticated
events_select_member	SELECT	authenticated
events_select_public	SELECT	anon
events_update_by_role	UPDATE	authenticated

Feature Demonstration - Event/Flyer Upload

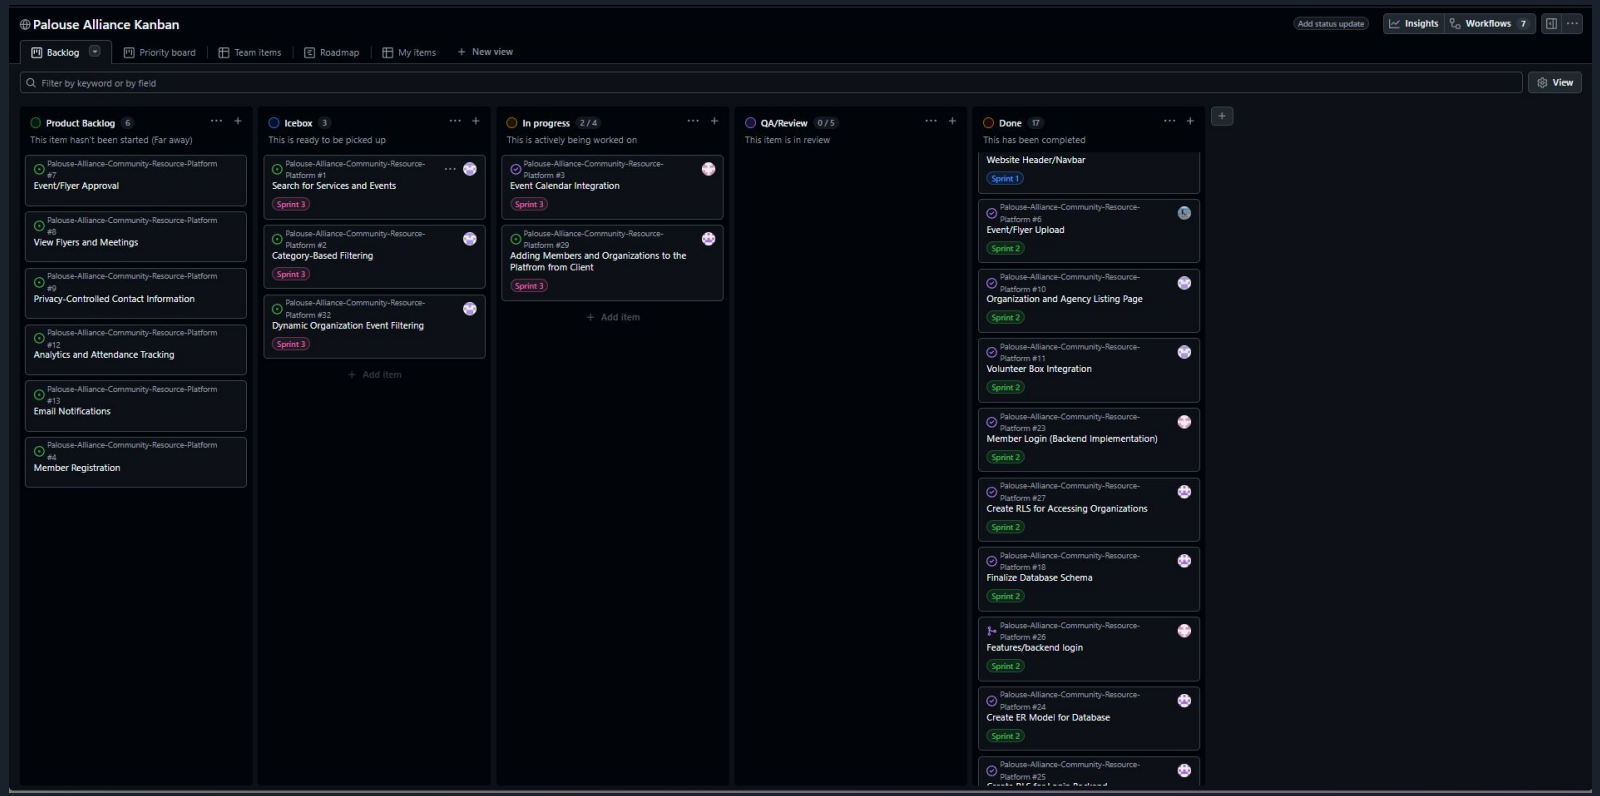
- Multi-step form for easy event creation
- Users can upload an event for their organization with an optional flyer and submit for review



Figma Prototype & Client Feedback

We first proposed a mockup based of initial requirements and it was approved with minor changes which have since been implemented. An overview of the pages is shown in the System Architecture, Database, User Interface, and Testing Plan - User Interface slide.

Kanban Overview & Team Contributions

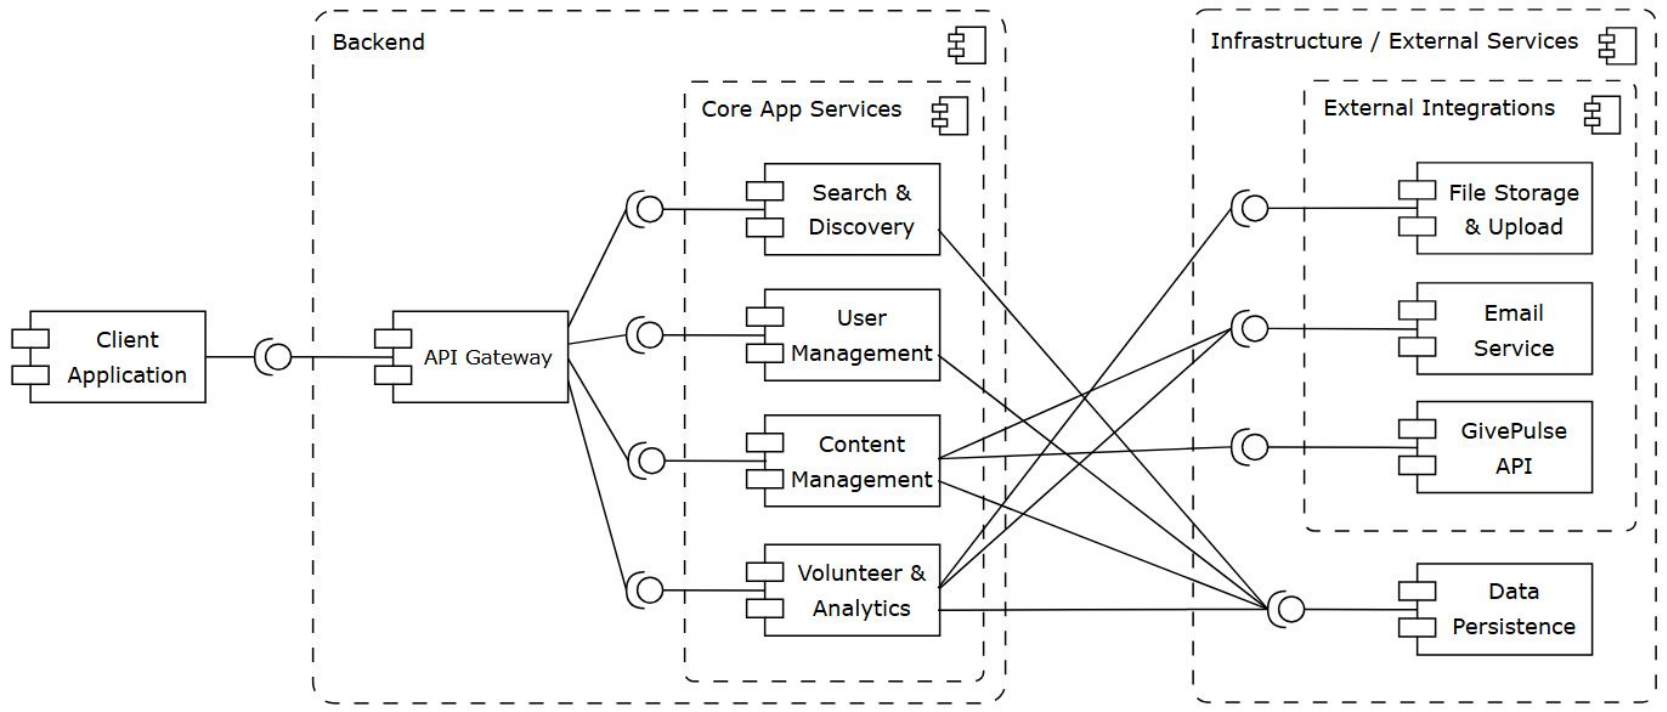


Static Functionality Demo

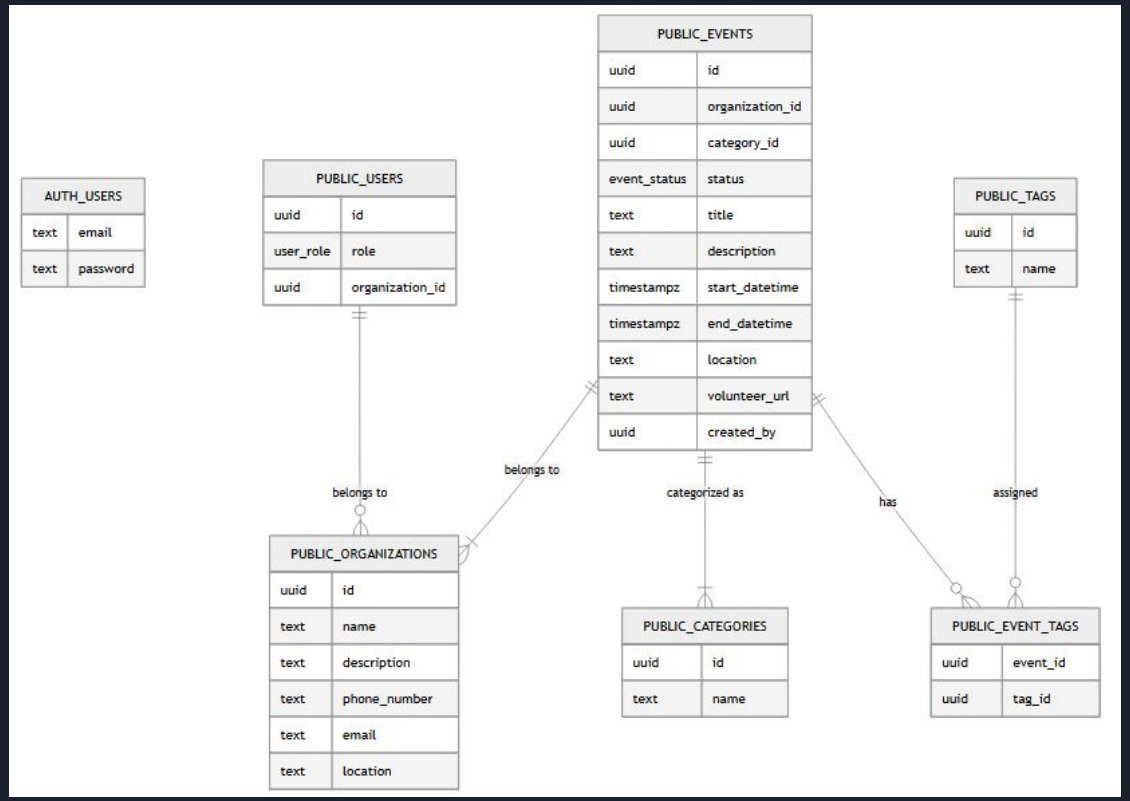
An overview of the pages is shown in the System Architecture, Database, User Interface, and Testing Plan - User Interface slide.

Each mockup was designed with accessibility and user experience in mind, and the clients liked the proposed designs.

System Architecture, Database, User Interface, and Testing Plan - System Architecture

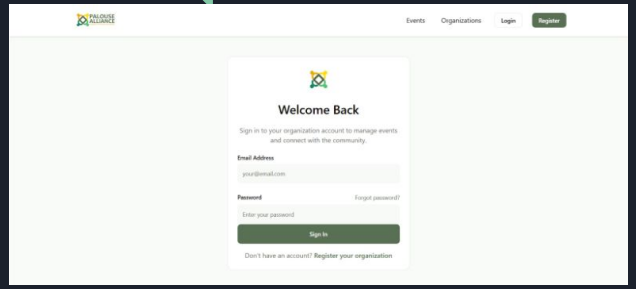


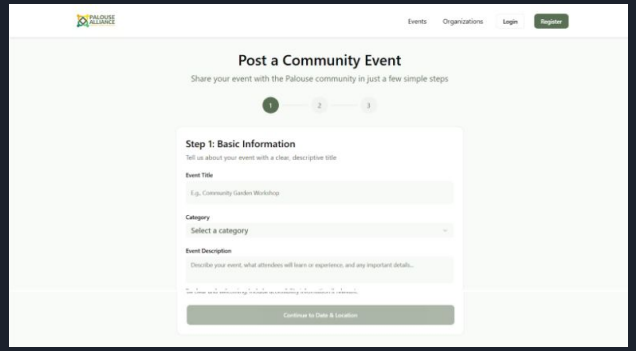
System Architecture, Database, User Interface, and Testing Plan - Database

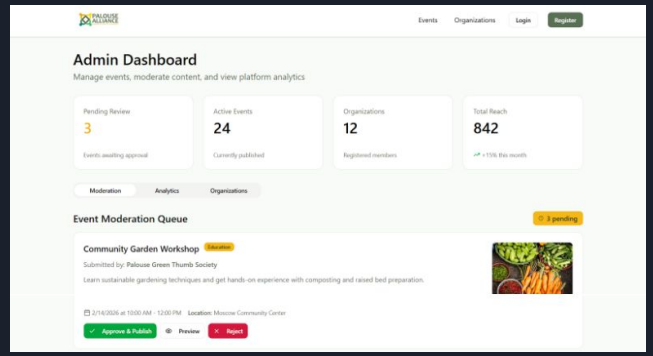


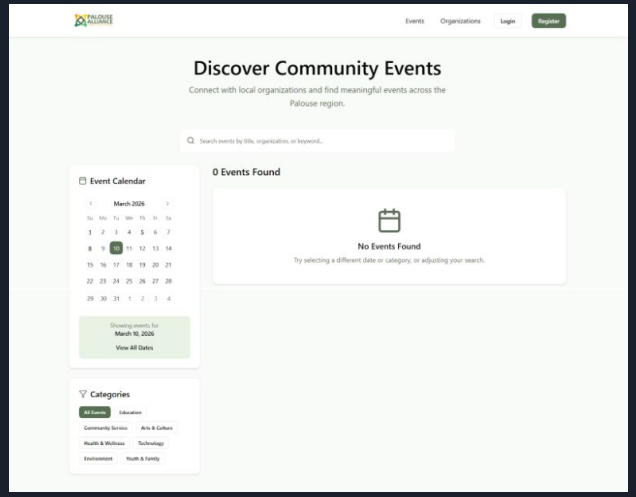
For symbols, || signifies one and exactly one, while O⋹ signifies a zero or many relationship.

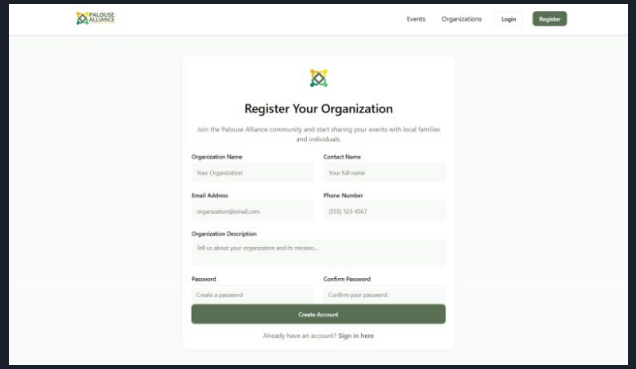
System Architecture, Database, User Interface, and Testing Plan - User Interface

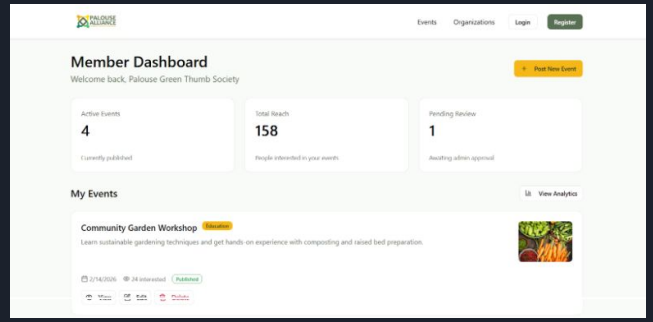












System Architecture, Database, User Interface, and Testing Plan - Testing Plan

This component isn’t required for our platform. We test the features we create with mock up data, but we cannot pass that in to avoid conflicts when the platform is publicly published.

We received a list of members and organizations from our clients, which we are actively adding to the database for more accurate “mock” data.

Responsible Use of AI

- AI was not used for any setup or documentation in repository.
- AI was used once for a minor code fix on the Organizations Page to resolve a data display issue.
- AI was used for spell check in our team submissions, which allowed for more concise and better communication.
    - All changes were reviewed and approved by a team member before being implemented.

Sprint Achievements and Challenges

Completed User Stories

- Organization and Agency Listing Page
- Volunteer Box Integration
- Member Login (Backend Implementation)
- Create RLS for Accessing Organizations
- Finalize Database Schema
- Features/backend login
- Create ER Model for Database
- Create RLS for Login Backend
- Create RLS for Event Calendar

Challenges

- There weren't any challenges we ran into, everything went as planned.

Next Steps and Sprint Retrospective

For Next Sprint

- Create an Event/Upload Flyer (Backend Integration)
- Search for Services and Events
- Category-Based filtering on calendar component
- Add initial members and organizations to the DB

What Went Well

- Bi-weekly meetings were enough to get feedback and have time for us to work.
- Members attended every meeting on time, and were cooperative when rescheduling was needed.

What Didn't

- Nothing, we completed all planned tasks.

Conclusion

In this sprint, we finalized a mockup design with the clients, started building fundamental core features, and setup a secure database. In doing this we are able to have a baseline application we can improve iteratively for our next sprints.

In our next sprint we plan to work on the actual user accounts, event creation, and calendar features.
